Operations Scheduling

Advanced Operations Management

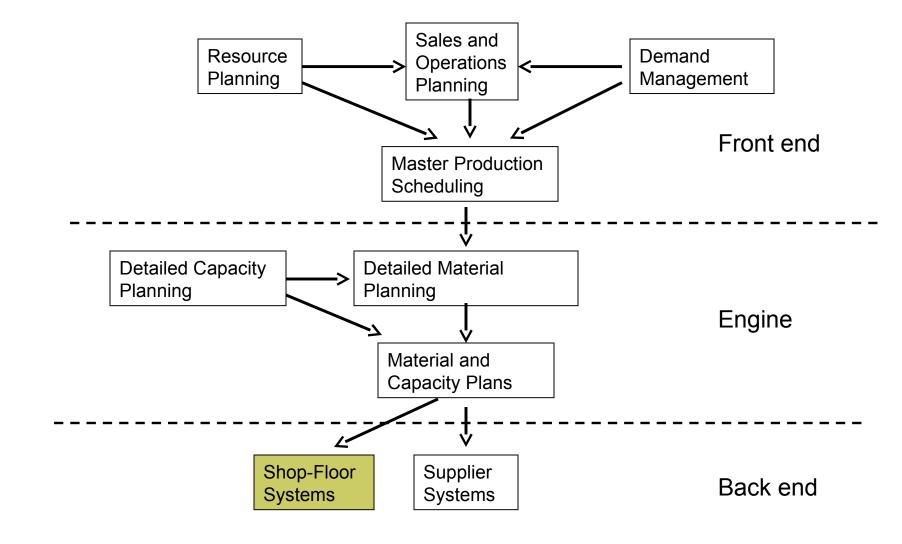

Dr. Ron Tibben-Lembke

Ch 16: 539-544,

Scheduling opportunities

- Job shop scheduling
- Personnel scheduling
- Facilities scheduling
- Vehicle scheduling
- Vendor scheduling
- Project scheduling
- Dynamic vs. static scheduling

You are here

Example

| Job | Processing | Time Due |
|-----|------------|----------|
| 1 | 6 | 18 |
| 2 | 2 | 6 |
| 3 | 3 | 9 |
| 4 | 4 | 11 |
| 5 | 5 | 8 |

What order should we do them in?

Example

Job Characteristics

- Arrival pattern: static or dynamic
- Number and variety of machines
 - We will assume they are all identical
- Number of workers
- Flow patterns of jobs:
 - all follow same, or many different
- Evaluation of alternative rules

Objectives

Many possible objectives:

- Meet due dates
- Minimize WIP
- Minimize average flow time through
- High worker/machine utilization
- Reduce setup times
- Minimize production and worker costs

Terminology

Flow shop: all jobs use M machines in same order

Job shop: jobs use different sequences

Parallel vs. sequential processing

Flow time: from start of first job until completion of job I

Makespan: start of first to finish of last

Tardiness: >= 0

Lateness: can be <0 or >0

Sequencing Rules

First-come, first-served (FCFS) order they entered the shop Shortest Processing Time (SPT) longest job done last Earliest Due Date (EDD) job with last due date goes last Critical Ratio (CR) - processing time / time until due, smallest ratio goes first

Other rules

- R Random
- LWR Least Work Remaining
- FOR Fewest Operations Remaining
- ST Slack Time
- ST/O-Slack Time per Operation
- NQ-Next Queue choose job that is going next to the machine with smallest queue
- LSU Least Setup

Performance

```
Quantities of interest L_i Lateness of i: can be +/- T_i Tardiness of i: always >= 0 E_i Earliness of i T_{max} Maximum tardiness
```

Example: FCFS

| Job | Time | Done | Due | Tardy |
|-------|------|------------|-----|-----------|
| 1 | 6 | 6 | 18 | 0 |
| 2 | 2 | 8 | 6 | 2 |
| 3 | 3 | 11 | 9 | 2 |
| 4 | 4 | 15 | 11 | 4 |
| 5 | 5 | <u> 20</u> | 8 | <u>12</u> |
| Total | | 50 | | 20 |

```
Mean flow time = 50 / 5 = 10.0
Average tardiness = 20 / 5 = 4.0
Number of tardy jobs = 4
Max. Tardy
```

Example: SPT

| Job | Time | Done | Due | Tardy |
|-------|------|-----------|-----|----------|
| 2 | 2 | 2 | 6 | 0 |
| 3 | 3 | 5 | 9 | 0 |
| 4 | 4 | 9 | 11 | 0 |
| 5 | 5 | 14 | 8 | 6 |
| 1 | 6 | <u>20</u> | 18 | <u>2</u> |
| Total | | 50 | | 8 |

```
Mean flow time = 50 / 5 = 10.0
Average tardiness = 8 / 5 = 1.6
Number tardy = 2
Max Tardy 6
```

Example: EDD

| Job | Time | Done | Due | Tardy |
|-------|------|-----------|-----|----------|
| 2 | 2 | 2 | 6 | 0 |
| 5 | 5 | 7 | 8 | 0 |
| 3 | 3 | 10 | 9 | 1 |
| 4 | 4 | 14 | 11 | 3 |
| 1 | 6 | <u>20</u> | 18 | <u>2</u> |
| Total | | 51 | | 6 |

```
Mean flow time = 51 / 5 = 10.2
Average tardiness = 6 / 5 = 1.2
Number tardy = 3
Max Tardy = 3
```

Critical Ratio

Critical ratio:

- looks at time remaining between current time and due date
- considers processing time as a percentage of remaining time
- CR = 1.0 means just enough time
- CR > 1.0 more than enough time
- □ CR < 1.0 not enough time

| Т | = | 0 | |
|-----------|----------|---|--|
| <u>Jc</u> | <u>b</u> | | |
| | 1 | | |
| | 2 | | |
| | 3 | | |

Critical Ratio 3.0 3.0 3.0 2.75 1.6

Job 5 is done first.

| □ T = 5 | Process | Due - | Critical |
|------------|-------------|----------------|--------------|
| <u>Job</u> | <u>Time</u> | <u>Current</u> | <u>Ratio</u> |
| 1 | 6 | 13 | 2.17 |
| 2 | 2 | 1 | 0.5 |
| 3 | 3 | 4 | 1.33 |
| 4 | 4 | 6 | 1.5 |

Job 2 is done second.

| □ T = 7 | Process | Due - | Critical |
|------------|-------------|----------------|--------------|
| <u>Job</u> | <u>Time</u> | <u>Current</u> | <u>Ratio</u> |
| 1 | 6 | 11 | 1.84 |
| 3 | 3 | 2 | 0.67 |
| 4 | 4 | 4 | 1.0 |

Job 3 is done third.

| T = 10 | Process | Due - | Critical |
|------------|-------------|----------------|--------------|
| <u>Job</u> | <u>Time</u> | <u>Current</u> | <u>Ratio</u> |
| 1 | 6 | 8 | 1.84 |
| 4 | 4 | 1 | 0.25 |

Job 4 is done fourth, and job 1 is last.

Critical Ratio Solution

| <u>Job</u> | <u>Time</u> | <u>Done</u> | <u>Due</u> | <u>Tardy</u> |
|------------|-------------|-----------------|------------|--------------|
| 5 | 5 | 5 | 8 | 0 |
| 2 | 2 | 7 | 6 | 1 |
| 3 | 3 | 10 | 9 | 1 |
| 4 | 4 | 14 | 11 | 3 |
| 1 | 6 | <u>20</u> 56 | 18 | <u>2</u> |
| Total | | 56 | | 7 |

```
Mean flow time = 56 / 5 = 11.2
Average tardiness = 7 / 5 = 1.4
Number tardy = 4
Max Tardy 3
```

Summary

| Max | | Averag | ge Num | ber |
|-----------------|----------------------|---------------|------------|-----|
| Method tardy | <u>Flow</u> Tardy | <u>Tardin</u> | <u>ess</u> | _ |
| FCFS | 10.0 | 4.0 | 4 | 12 |
| SPT | 10.0 | 1.6 | 2 | 6 |
| EDD | 10.0 | 1.2 | 3 | 3 |
| CR | 11.2 | 1.4 | 4 | 3 |

Minimizing Average Lateness

- Mean flow time minimized by SPT
- For single-machine scheduling, minimizing the following is equivalent:
 - Mean flow time
 - Mean waiting time
 - Mean lateness

Minimize Max Lateness

Earliest Due Date (EDD) minimizes maximum lateness

Minimizing Number of Tardy Jobs

Moore's Algorithm:

- 1. Start with EDD solution
- 2. Find first tardy job, i. None? Goto 4
- 3. Reject longest job in 1- i. Goto 2.
- 4. Form schedule by doing rejected jobs after scheduled jobs.
- Rejects can be in any order, because they will all be late.

Moore's Example

Start with EDD schedule

| Job | <u>T</u> ime | Done | Due | Tardy |
|-----|--------------|------|-----|-------|
| 2 | 2 | 2 | 6 | 0 |
| 5 | 5 | 7 | 8 | 0 - |
| 3 | 3 | 10 | 9 | 1 |
| 4 | 4 | 14 | 11 | 3 |
| 1 | 6, | 20 | 18 | 2 |
| | | | | |

Job 3 is first late job.
Job 2 is longest of jobs 2,5,3.

Moore's Example

| Job | Time | Done | Due | Tardy |
|-----|------|------|-----|-------|
| 2 | 2 | 2 | 6 | 0 |
| 3 | 3 | 5 | 9 | 0 |
| 4 | 4 | 9 | 11 | 0 |
| 1 | 6 | 15 | 18 | 0 |
| 5 | 5 | 20 | 8 | 12 |

```
Average Flow = 51 / 5 = 10.2
Average tardiness = 12 / 5 = 2.4
Number tardy = 1
Max. Tardy = 12
```

Summary 2

| Average | e Num | ber |
|----------------|-------------------------|---|
| <u>Tardine</u> | <u>SS</u> | _ |
| 4.0 | 4 | 12 |
| 1.6 | 2 | 6 |
| 1.2 | 3 | 3 |
| 1.4 | 4 | 3 |
| 2.4 | 1 | 12 |
| | Tardine 4.0 1.6 1.2 1.4 | 1.621.231.44 |

Multiple Machines

- N jobs on M machines:
- □ (N!)^Mpossible sequences.
- For 5 jobs and 5 machines = 25 billion
- Complete enumeration is not the way

Multiple Machines

2 jobs, 2 machines.

```
Job M1 M2
I 4 1
J 1 4
```

Four possible sequences:

      J
```

Four possible sequences:

Two Machines

Two Machines

- Permutation schedules: IJ IJ, JI JI
 - Jobs processed same sequence on both
- For N jobs on two machines, there will always be an <u>optimal</u> permutation schedule.

2 Machines, N Jobs (Johnson's Algorithm)

- A_i = processing time of job I on machine A
- B_i = processing time of job I on machine B
- 1. List A_i and B_i in two columns
- 2. Find smallest in two columns. If it is in A, schedule it next, if it's in B, then last.
- 3. Continue until all jobs scheduled.

Johnson Example

| <u>Job</u> | <u>A</u> | <u>B</u> |
|------------|----------|----------|
| 1 | 5 | 2 |
| 2 | 1 | 6 |
| 3 | 9 | 7 |
| 4 | 3 | 8 |
| 5 | 10 | 4 |

1. Job 2 is smallest, so it goes first.

```
Seq: 2, , , ,
```

Johnson Example

```
    Job
    A
    B

    1
    5
    2

    2
    1
    6

    3
    9
    7

    4
    3
    8

    5
    10
    4
```

- 1. Job 2 goes first.
- 2. Job 1 is next smallest, in B, so goes last.

```
Seq: 2, , , , 1
```

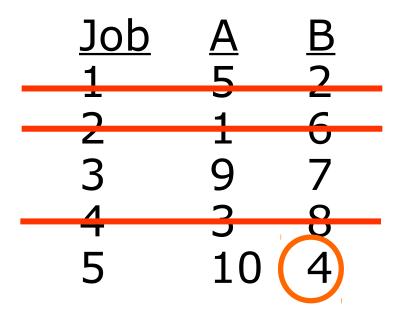

Johnson Example

- 1. Job 2 goes first.
- 2. Job 1 goes last.
- 3. Job 4 is smallest, in A column, so it goes next.

Seq: 2, 4, , , 1

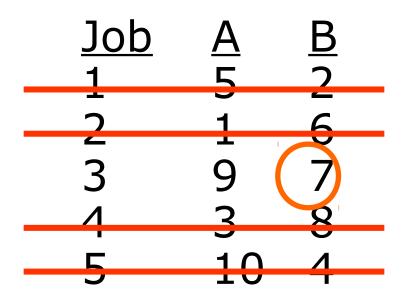

Johnson Example

- 1. Job 2 goes first.
- 2. Job 1 goes last.
- 3. Job 4 goes next.
- 4. Job 5 smallest in B, comes next to last.

Seq: 2, 4, , 5, 1

Johnson Example

Seq: 2, 4, 3, 5, 1

- 1. Job 2 goes first.
- 2. Job 1 goes last.
- 3. Job 4 goes next.
- 4. Job 5 next to last.
- 5. Job 3 comes next.

Conclusions

- Single machine scheduling:
 - FCFS, SPT, EDD, CR, Moore's Algorithm
- Two machines:
 - Johnson's Algorithm
- Performance:
 - Avg Lateness, Max Tardy, Avg Tardy, Number of jobs Tardy

Scheduling Days Off

- Compute no. people needed each day.
- 2. Find the smallest two consecutive days
 - Highest number in the pair is <= highest number in any other pair
 - Those two days will be the first worker's days off
- Subtract one from the days the first worker wasn't scheduled
- 2. Repeat

Example - Workers needed each day

M T W Th F Sa Su 4 3 4 2 3 1 2

Example

| | M | Τ | W | Th | F | Sa | Su |
|----|---|---|---|----|----|----|----|
| #1 | 4 | 3 | 4 | 2 | 3 | 1 | 2 |
| #2 | 3 | 2 | 3 | 1 | 2 | 1 | 2 |
| #3 | 2 | 1 | 2 | 0 | _1 | 1 | 2 |
| #4 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| #5 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

Example - Retry

| | M | Т | W | Th | F | Sa | Su |
|----|---|---|---|-----|---|----|----|
| #1 | 4 | 3 | 4 | 2 | 3 | 1 | 2 |
| #2 | 3 | 2 | 3 | 1 (| 2 | 1 | 2 |
| #3 | 2 | 1 | 2 | 0 | 2 | | 1 |
| #4 | 1 | 0 | 1 | 0 | 1 | 1 | 1 |
| #5 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

Example - 4 days

| | M | Т | W | Th | F | Sa | Su |
|----|---|---|---|----|---|----|----|
| #1 | 4 | 3 | 4 | 2 | 3 | 1 | 2 |
| #2 | 3 | 2 | 3 | 1 | 2 | 1 | 2 |
| #3 | 2 | 1 | 2 | 0 | 1 | 1 | 2 |
| #4 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |

Do you want to work the #4 schedule?

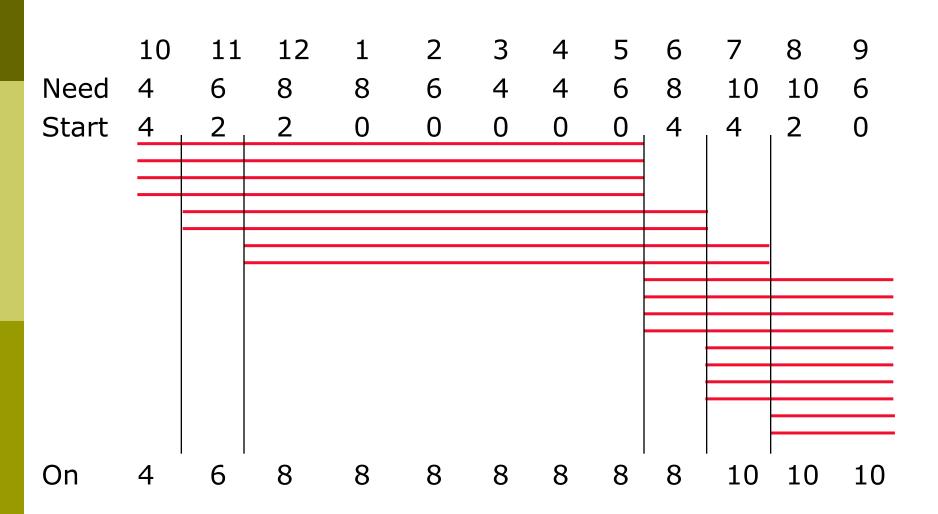

Scheduling Daily Work Times

Different # people needed in different areas at different times

Scheduling Hourly Times

- When should people start shifts?
- "First Hour" principle:
 - For first hour, assign # people needed that hour
 - Each additional hour, add more if needed
 - When shift ends, add more, only if needed

Hourly Work Times

Production vs. Transfer batch sizes

Lot Sizes all 1,000

p. 552

Production Lot Size = 1,000

Transfer Batch Size = 100

Production Lot Size = 200

Transfer Batch Size = 100

Production Lot Size = 500

HW, p. 567 - Due 12/9
